PROJECT REVIEW : MILESTONE PROJECT – 1

Date: 24-03-2026

“END -TO - END EVENT LIFE CYCLE AND TICKETING PLATFORM”

SDG 9 – Industry, Innovation and Infrastructure

Presented By:

R.SATHWIK- VTU26316 – 23UECS0478

Courses Handling Faculty:

Dr. HAFIZUR RAHMAN,
ASSOCIATE PROFESSOR.

INTRODUCTION

1

- Event management is often difficult because planning, registration, ticket booking, payments, and attendee tracking are handled separately.
- This creates delays, errors, poor coordination, and a confusing experience for both organizers and participants.
- The project is important because it brings all event activities into one centralized digital platform.
- It helps reduce manual work, improves accuracy, saves time, and makes event handling more efficient.
- In the real world, such systems are useful for colleges, conferences, workshops, concerts, seminars, and business events.
- The platform allows organizers to create events, manage schedules, sell tickets, and monitor registrations easily.
- It also enables users to book tickets, receive confirmations, and attend events with a smooth process.
- Overall, the system provides an end-to-end solution for the complete event life cycle and ticketing process.

PROBLEM STATEMENT

1

2

3

4

5

6

7

8

9

- In many organizations, event management and ticket booking are handled through disconnected systems or manual processes.
- This creates problems such as duplication of work, data inconsistency, booking errors, delayed confirmations, and difficulty in tracking attendees.
- Organizers face challenges in managing event schedules, seat availability, ticket pricing, and payment records efficiently.
- Users may also experience inconvenience while registering, selecting tickets, and completing payments.
- Hence, there is a need for an integrated platform that can automate and simplify the entire event life cycle and ticketing process.

OBJECTIVE(S)

1

2

3

4

5

6

7

8

9

- To design and develop a centralized platform for managing the complete event life cycle
- To enable users to browse events and view complete event details.
- To provide a smooth ticket booking workflow with attendee information collection.
- To support multiple seat categories and flexible ticket pricing.
- To implement secure payment processing and booking confirmation.
- To help organizers manage seat availability, bookings, and attendee data efficiently.
- To reduce manual work, improve accuracy, and enhance user experience.

PROPOSED SYSTEM

1

2

3

4

5

6

7

8

9

- ✓ The proposed system is a centralized web application for managing the complete event life cycle.
- ✓ It allows organizers to publish events with title, date, venue, pricing, and seat availability.
- ✓ Users can browse available events and view complete event details before booking.
- ✓ The system provides a step-by-step ticket booking workflow for attendee information collection.
- ✓ Users can choose seat categories such as Economy, Standard, and VIP.
- ✓ It includes a structured payment module with order summary and secure transaction flow.
- ✓ Booking records, attendee details, and payment data are stored in the database.
- ✓ Compared to existing systems, it offers better automation, transparency, and ease of use.

PROPOSED SYSTEM ARCHITECTURE

1. User / Admin

Represents the two main actors of the system.

The admin manages events, pricing, and availability, while the user browses events, books tickets, selects seat types, and makes payments.

2. Frontend Interface

This is the user-facing part of the application developed using HTML, CSS, JavaScript, and Bootstrap.

It displays the home page, event details page, booking form, seat type selection, and payment page.

3. Backend Application

This is the core processing layer developed using Java and Spring Boot.

It handles request processing, booking validation, seat availability checking, ticket management, and payment-related operations.

4. Database

The database stores all important system records such as event details, user details, booking records, seat categories, payment data, and booking history.

5. Output / Confirmation

This layer shows the final result to the user, such as event listing, booking status, payment confirmation, order summary, and stored booking information.

WORKFLOW

MODULE DESCRIPTION

1

----- Example for reference only ----- (Change according to your project)

2

Module 1: User Management

Handles user registration, login, and profile management with secure authentication.

3

Module 2: Core Processing

Implements the main business logic and processes user inputs efficiently.

4

5

Module 3: Database Management

Manages data storage, retrieval, and ensures data integrity.

6

7

Module 4: Reporting & Analytics

Generates reports and visual insights for better decision-making.

A screenshot of the EventHub login page. The page has a dark blue background. At the top, there is a red and white logo followed by the text "EventHub" in white. Below the logo, the text "Sign in to continue" is displayed in white. Underneath, a smaller line of text says "Enter your credentials to access the platform". There are two input fields: "Username" and "Password". The "Username" field has a placeholder text "Enter username". The "Password" field has a placeholder text "Enter password". Below the input fields is a large blue button with the text "Login" in white. At the bottom, there is a line of text that says "Demo credentials: admin / admin123 | user / user123". Below this, there is a link that says "No account? Sign up here".

IMPLEMENTATION SCREENSHOTS

ADVANTAGES & LIMITATIONS

❑ Advantages

- Centralized platform for complete event management and ticket booking.
- Easy event browsing, seat selection, and payment process.
- Reduces manual work and minimizes booking errors.
- Improves transparency in ticket availability and booking status.
- Provides faster confirmation and better user experience.
- Stores booking and payment records in an organized manner.

❑ Limitations

- Requires internet connection for smooth access and operation.
- Payment module may need real gateway integration for deployment.
- System performance may reduce during high user traffic.
- Advanced analytics and reporting features are limited in the current version.
- Depends on proper database maintenance and backend support.
- Mobile app support and multi-language features are not included now.
